

eBioscience™ Streptavidin Super Bright 645

Catalog Number 64-4317-82

Pub. No. MAN0018614 Rev. B.0

 **WARNING!** Read the Safety Data Sheets (SDSs) and follow the handling instructions. Wear appropriate protective eyewear, clothing, and gloves. Safety Data Sheets (SDSs) are available from thermofisher.com/support.

Product description

Streptavidin (SA, Sav) is a 52.8 kDa tetramer that binds to biotin with high affinity. Streptavidin fluorochrome conjugates are commonly used in indirect staining protocols to detect biotinylated primary antibodies in flow cytometry.

Super Bright 645 is a tandem dye that can be excited with the violet laser line (405 nm) and emits at 645 nm. We recommend using a 660/20 or equivalent bandpass filter. Please make sure that your instrument is capable of detecting this fluorochrome.

Product specifications

Concentration	0.2 mg/mL
Excitation/ Emission	405 nm/ 645 nm
Formulation	Aqueous buffer, 0.09% sodium azide. May contain carrier protein/stabilizer.
Storage	Store at 2–8°C, protected from light. Do not freeze.
Applications reported	Flow cytometric analysis.
Applications tested	Flow cytometric analysis to detect biotinylated primary antibodies.
Batch code	See product label.
Use by	See product label.

Staining guidelines

- Workflow: Incubate cells with primary biotinylated antibody, wash twice, and stain with SAV conjugate.
- Stain biotinylated primary antibodies with $\leq 0.125 \mu\text{g}/\text{test}$.
- A test is defined as the amount (μg) of streptavidin fluorochrome conjugate that stains a cell sample in a final volume of 100 μL .
- Determine optimal cell number empirically, but typical values can range from 10^5 to 10^8 cells/test.
- Titrate streptavidin carefully to determine optimal performance in the assay of interest.
- When using two or more Super Bright dye-conjugated antibodies in a staining panel, Super Bright Complete Staining Buffer (Cat. No. SB-4401-42) is recommended to minimize nonspecific polymer interactions. See the datasheet for Super Bright Staining Buffer for more information.
- The tandem dye is sensitive to photo-induced oxidation. Protect the vial and stained samples from light.

Fixation guidelines

- Some generalizations regarding fluorophore performance after fixation can be made, but clone specific performance should be determined empirically.
- Samples can be stored in IC Fixation Buffer (Cat. No. 00-8222-49) (100 μL of cell sample + 100 μL of IC Fixation Buffer) or 1-step Fix/Lyse Solution (Cat. No. 00-5333-57) for up to 3 days in the dark at 4°C with minimal impact on brightness and FRET efficiency/compensation.

Experimental results

Swiss Webster mouse splenocytes were stained with 0.125 µg of CD4 Monoclonal Antibody, Biotin (Cat. No. 13-0042-82) followed by Streptavidin Super Bright 645. Total viable cells were used for analysis.

Limited product warranty

Life Technologies Corporation and/or its affiliate(s) warrant their products as set forth in the Life Technologies' General Terms and Conditions of Sale at www.thermofisher.com/us/en/home/global/terms-and-conditions.html. If you have any questions, please contact Life Technologies at www.thermofisher.com/support.

Explanation of Symbols

Symbol	Description	Symbol	Description	Symbol	Description
	Manufacturer		Catalog number		Batch code
	Use by		Temperature limitation		

Life Technologies Corporation | 5781 Van Allen Way | Carlsbad, CA 92008
