

eBioscience™ Fixable Viability Dye eFluor™ 520

Catalog Number: 65-0867

Also known as: FVD eFluor® 520

For Research Use Only. Not for use in diagnostic procedures.

Staining of 4-day Con A-stimulated C57Bl/6 splenocytes with Fixable Viability Dye eFluor® 520 (right). Cells in the large scatter population were used for analysis (left).

Product Information

Contents: eBioscience™ Fixable Viability Dye eFluor™ 520

Catalog Number: 65-0867

Formulation: DMSO, pre-diluted to test size

Temperature Limitation: Store at less than or equal to -70°C. Protect from light and moisture.

Batch Code: Refer to vial

Use By: Refer to vial

LOT

Description

Fixable Viability Dye eFluor® 520 is a viability dye that can be used to irreversibly label dead cells prior to cryopreservation, fixation and/or permeabilization procedures. Unlike 7-AAD and propidium iodide, cells labeled with Fixable Viability Dyes can be washed, fixed, permeabilized, and stained for intracellular antigens without any loss of staining intensity of the dead cells. Thus, using Fixable Viability Dyes allows dead cells to be excluded from analysis when intracellular targets are being studied. Fixable Viability Dyes may be used to label cells from all species.

Fixable Viability Dye eFluor® 520 can be excited by the blue laser line (488 nm) and has a peak emission of 522 nm that can be detected using a 530/30 band pass filter (equivalent to FITC). Please make sure that your instrument is capable of detecting this dye. For compensation, it is recommended to use a sample of the cells of interest stained with the Fixable Viability Dye. If the percentage of dead cells is expected to be less than 5%, then it is recommended to take a small aliquot of cells and heat them at 65°C for 1 minute then immediately place on ice for 1 minute. After this treatment, the heat-killed cells can be combined 1:1 with live cells and then stained with the Fixable Viability Dye.

Fixable Viability Dye eFluor® 520 is supplied as a pre-diluted solution prepared in high-quality, anhydrous DMSO. It should be protected from light and moisture. Store at less than or equal to -70°C with desiccant. It may be freeze-thawed up to 20 times. Allow vial to equilibrate to room temperature before opening.

Applications Reported

Fixable Viability Dye eFluor® 520 has been reported for use in flow cytometric analysis.

Applications Tested

Fixable Viability Dye eFluor® 520 has been pre-titrated and tested by flow cytometric analysis of mouse thymocytes or cultured cells. Fixable Viability Dyes are fully compatible with both IC Fixation and Permeabilization Buffers and the Foxp3/Transcription Factor Staining Buffer Set. This can be used at 1 µL/mL of cells resuspended at 1-10x10⁶ cells per mL in azide-free and serum/protein-free PBS. It is recommended that the concentration used be determined by each investigator for optimal performance in the assay of interest.

eBioscience™ Fixable Viability Dye eFluor™ 520

Catalog Number: 65-0867

Also known as: FVD eFluor® 520

For Research Use Only. Not for use in diagnostic procedures.

Special Notes

Staining with Fixable Viability Dye eFluor® 520 may be done before or after surface staining. Cells may be cryopreserved after staining with Fixable Viability Dye eFluor® 520 with no adverse effect on staining intensity of dead cells after thawing.

Fixable Viability Dye Cell Staining Protocol

Introduction

Fixable Viability Dyes (FVD) are viability dyes that can be used to irreversibly label dead cells prior to cryopreservation, fixation and/or permeabilization procedures. Unlike 7-AAD and propidium iodide, cells labeled with FVD can be washed, fixed, permeabilized, and stained for intracellular antigens without any loss of staining intensity of the dead cells. Thus, using FVD allows dead cells to be excluded from analysis when intracellular targets are being studied. FVD may be used to label cells from all species.

The following table summarizes the available FVD along with their optical properties:

Table of Fixable Viability Dyes

Catalog Number	Format	Excitation source (nm)	Emission (nm)
65-0868	Fixable Viability Dye eFluor™ 455UV	350	455
65-0863	Fixable Viability Dye eFluor™ 450	405	450
65-0866	Fixable Viability Dye eFluor™ 506	405	506
65-0867	Fixable Viability Dye eFluor™ 520	488	522
65-0864	Fixable Viability Dye eFluor™ 660	633	660
65-0865	Fixable Viability Dye eFluor™ 780	633	780
65-2860	Fixable Viability Dye eFluor™ 506/780 Sample Pack	-	-

Table 1: Table of Fixable Viability Dyes

General Notes

Best practices when using Fixable Viability Dyes

1. FVD are supplied as a pre-diluted solutions prepared in high-quality, anhydrous DMSO. They should be protected from light and moisture. Store at less than or equal to -70°C with desiccant. They may be freeze-thawed up to 20 times.
2. Allow vial of FVD to equilibrate to room temperature before opening.
3. For the brightest staining, it is best to stain with FVD in azide- and protein-free phosphate-buffered saline (PBS).
4. Cells may be stained with FVD before or after surface staining. After staining with FVD, cells may also be cryopreserved for analysis at a later time. It is recommended that each investigator determine the optimal concentration for the assay of interest.
5. Although FVD may often be used in combination with fixation, permeabilization and intracellular staining, FVD may also be used experiments using live, unfixed cells.
6. For compensation, it is recommended to use a sample of the cells of interest stained with the FVD only. If the percentage of dead cells is expected to be less than 5%, then it is recommended to take a small aliquot of cells and heat them at 65°C for 1 minute, then immediately place on ice for 1 minute. After this treatment, the heat-killed cells can be combined 1:1 with live cells and then stained with the FVD.

Alternative staining procedures (Protocols C, D, and E)

1. Protocols C, D and E are modifications for ease-of-use which may result in reduced staining intensity of the dead cells. These alternative staining protocols should be avoided if maximum staining intensity is desired. It is recommended that each investigator determine whether these protocol modifications provide sufficient staining intensity of dead cells.
2. It is possible to stain un-lysed, whole blood with FVD. See Protocol C below for details.
3. It is possible to stain in azide-free, but protein-containing PBS. This method may result in a small reduction in the staining intensity of the dead cell population. See Protocol D below for details.
4. It is possible to stain in azide- and protein-containing PBS, such as Flow Cytometry Staining Buffer (Cat. No. 00-4222). This method may result in a significant decrease in the staining intensity of the dead cell population and/or an increase in background staining of the live cell population. See Protocol D below for details.
5. It is possible to add the FVD to an antibody cocktail before addition to the cells. The FVD should spend as little time as possible in the cocktail prior to staining. It is best to use azide-free, protein containing buffer for dilution of the antibody cocktail and FVD. See Protocol E below for details.

For Research Use Only. Not for use in diagnostic procedures.

Protocol A: Standard staining in tubes

Materials

- Phosphate-buffered saline (PBS), azide- and protein-free
- Flow Cytometry Staining Buffer (Cat. No. 00-4222)
- 12x75 mm round bottom test tubes

Experimental Procedure

1. Prepare cells in 12x75 mm tubes.
2. Wash cells 2 times in azide-free and protein-free PBS.
3. Resuspend cells at $1-10 \times 10^6$ /mL in azide-free and serum/protein-free PBS.

Note: For consistent staining of cells, we do not recommend staining in less than 0.5 mL.

4. Add 1 μ L of FVD per 1 mL of cells and vortex immediately.
5. Incubate for 30 minutes at 2-8°C, protect from light.
6. Wash cells 1-2 times with Flow Cytometry Staining buffer or equivalent.
7. Continue with experiment, as desired.

Protocol B: Staining in 96-well plates

Materials

- Phosphate-buffered saline (PBS), azide- and protein-free
- Flow Cytometry Staining Buffer (Cat. No. 00-4222)
- 96-well assay plates

Experimental Procedure

1. Prepare cells as desired in 96-well plates.
2. Wash cells 2 times in azide-free and serum/protein-free PBS. Completely decant supernatant.
3. Prepare a working solution of the FVD by diluting it 1:1000, in azide- and serum/protein-free PBS. Make enough for 100 μ L/well. For example, if you need enough for 96 wells, add 10 μ L of FVD to 10 mL of PBS.
4. Add 100 μ L of the working solution of the FVD to each well and mix immediately by pipetting or gentle vortexing.
5. Incubate for 30 minutes at 2-8°C, protect from light.
6. Wash cells 1-2 times with Flow Cytometry Staining buffer or equivalent.
7. Continue with experiment, as desired.

Protocol C: Staining with FVD in un-lysed whole blood

Materials

- Phosphate-buffered saline (PBS), azide- and protein-free
- Flow Cytometry Staining Buffer (Cat. No. 00-4222)
- Red blood cell lysis buffer, such as 1X RBC Lysis Buffer (Cat. No. 00-4333), 10X RBC Lysis Buffer (Multi-species) (Cat. No. 00-4300), or 1-step Fix/Lyse Solution (10X) (Cat. No. 00-5333)
- 12x75 mm round bottom test tubes

Experimental Procedure

1. Add un-lysed whole blood to 12x75 mm tubes.
2. Add 1 μ L of FVD per 100 μ L of whole blood.
3. Add other surface staining antibodies after addition of the FVD.

Note: Alternatively, FVD may be added directly to the surface staining antibody cocktail at 1 μ L per sample to be stained. This cocktail should be made just prior to addition to whole blood samples. See Protocol E below for details.

4. Incubate for 30 minutes at 2-8°C, protect from light.
5. Wash samples 1-2 times with Flow Cytometry Staining buffer.
6. Lyse red blood cells and continue with experiment, as desired.

Protocol D: Staining with FVD in azide- and/or protein-containing staining buffers

Materials

- Flow Cytometry Staining Buffer (Cat. No. 00-4222)
- 12x75 mm round bottom test tubes

Experimental Procedure

1. Prepare cells in 12x75 mm tubes at 1-10x10⁶/mL in Flow Cytometry Staining buffer.
2. Add 1 µL of FVD per 1 mL of cells and vortex immediately.
3. Incubate for 30 minutes at 2-8°C, protect from light.
4. Wash cells 1-2 times with Flow Cytometry Staining buffer.
5. Continue with experiment, as desired.

Protocol E: Staining with FVD in an antibody cocktail

Materials

- Phosphate-buffered saline (PBS), azide- and protein-free
- Flow Cytometry Staining Buffer (Cat. No. 00-4222)
- 12x75 mm round bottom test tubes

Experimental Procedure

1. Prepare cells in 12x75 mm tubes and resuspend at 1-10x10⁶ in 100 µL of azide- and serum/protein free PBS, as described in Protocol A, for maximum brightness.

Note: If maximal brightness is not critical, cells may be resuspended in Flow Cytometry Staining buffer (as described in Protocol D).

2. Prepare desired antibody cocktail in Flow Cytometry Staining buffer.
3. Immediately prior to addition to cells, add FVD to antibody cocktail at 0.5-1 µL per sample to be stained. Mix well.
4. Add FVD/antibody cocktail to cell samples.
5. Incubate for 30 minutes at 2-8°C, protect from light.
6. Wash cells 1-2 times with Flow Cytometry Staining buffer.
7. Continue with experiment, as desired.
